

Optimal Restaurant Location Finder Toronto

Data

The sources of data used for this project was:

- Wikipedia Toronto "Borough", "Neighbourhood", and "Postal Code" data.
- geopy geocoder, convert to obtain Coordinates
- Foursquare Venue data

Postal Code	Borough	Neighbourhood
B	MNR	North York (Parkwood)
#	MNR	North York (Isabella Village)
B	MND	Downtown Toronto (Riverside Park, Harbourfront)
B	MNR	North York (Lawrence Manor, Lawrence Heights)
F	MNR	Downtown Toronto (Queens Park, Ontario Provincial Government)
...		
181	MND	Eglinton (The Kingsway, Montgomery Road, Old Mill North)
186	MNR	Downtown Toronto (Cherry and Wellesley)
188	MNR	East Toronto (Business reply mail Processing Centre, South C)
179	MNR	Eglinton (Old Mill South, Kingsmill Park, Sunnyside, No.)
179	MND	Eglinton (Marina Bay, The Queensway (New), South of Blue)

100 rows x 3 columns

1 - Wikipedia Scraped DataFrame

Method

- Once the Toronto Location data is cleaned combine with API Data
 - API data provides venue information like venue category, venue locations, venue frequency.
- The goal is to prepare the data to prepare and visualize the relationship and activity between location and restaurants.

2 - Neighbourhood Maps

Data is cleaned and prepared for Machine Learning, and Features extracted for Machine Learning.

- Filtered all columns for only Restaurants
- User input to index specific type of restaurant to be analyzed

```

In [7]: types = df['type']
# Filter for Restaurants
df = df[df['type'] == 'Restaurant']

```

Machine Learning

- Found Optimal cluster number was 6 using Elbow Method
- Used KMeans Unsupervised learning to create 6 clusters based off restaurant frequency and location data

Results

Cluster0 had the neighbourhoods with the most potential to open up a new Sushi Restaurant. More specifically the sum of the mean frequency for cluster 0 was the largest out of all the other clusters.

Cluster Labels	0	1	2	3	4	5
Sushi Restaurant	0.37	0.20	0.67081	0.10	0.11	0.17

Neighborhood	Cluster Label	Algerian Restaurant	African Restaurant	American Restaurant	Asian Restaurant	Belgian Restaurant	Brazilian Restaurant	Chinese Restaurant	Caribbean Restaurant	Eastern Restaurant	Japanese Restaurant	Thai Restaurant
0	Agincourt	0	0.0	0.0	0.01	0.01	0.0	0.0	0.01	0.01	0.0	0.0
1	Alhambra	0	0.0	0.0	0.00	0.00	0.0	0.0	0.00	0.00	0.0	0.0
2	Bellflower	0	0.0	0.0	0.00	0.00	0.0	0.0	0.00	0.00	0.0	0.0
3	Bayview Village	0	0.0	0.0	0.01	0.00	0.0	0.0	0.01	0.01	0.0	0.0
4	Bedford Park	0	0.0	0.0	0.01	0.00	0.0	0.0	0.00	0.01	0.0	0.0

The Best neighbourhoods to open a Sushi Restaurant in cluster 0 would be shown in the bar graph. The y axis is based off Sushi Restaurant Frequency/ visits per neighbourhood, to find the neighbourhood that had the most frequency and the least amount of restaurants.

Next Step

A good extension for this project in the future, is to find data that would be able to create a time series plot of the frequency in visits, and use a regression algorithm to predict what the demand for such a restaurant is in the future.

Another good project would be to find the most optimal places to rent/share commercial kitchens. That mixed with data on food delivery may be promising for business's to survive situations like Covid where they can pay a fraction of the cost to share existing kitchens and have the bare minimum of staff. With chef's spread around neighbourhood's with the highest demand, not keeping all of the chefs "in the same basket" they would generate more revenue, and be more disaster resistant.
